1. Introduction

Name and Address of Client: College of Technology (imaginary client)

Summary of the Problem:

Since it is not efficient enough to inform students and staff about events through physical announcements or social media alone, there is a need for a centralized system. This project aims to provide a web-based event management solution for the college that streamlines the process of sharing event information, booking tickets, and showcasing event media. It ensures students are always updated and helps administrators manage events more effectively.

2. Background and motivation

In many colleges, event announcements are made through posters, notice boards, or scattered social media posts. These methods are often inefficient, fail to reach all students promptly, and lack a centralized place for students to view details, book tickets, or revisit past event highlights.

The motivation behind this project is to solve this communication gap by developing a centralized Event Management System tailored for a college environment. This system helps students stay informed about upcoming events, explore media from previous ones, and allows admins to manage event-related content with ease.

By bringing together all event-related activities into a single platform, this project aims to enhance student engagement and reduce manual effort for college staff.

3. Goal, objective, and scope

The goal:

- To design and implement a centralized web-based Event Management System for a college, allowing smooth communication and interaction between students and administrators regarding events.

Objective:

- Enable students to view upcoming and past events.
- Allow students to book event tickets online.
- Provide a gallery to display photos and videos of past events.
- Offer admins the ability to create, update, and manage event details.
- Allow admins to upload media and manage student/admin accounts.
- Maintain a record of payments made by students for events.

The scope includes:

- Home Page: General introduction and navigation.
- Event Page: Lists all events with details and booking options.
- Gallery Page: Displays media content from past events.
- Student Panel: Dashboard, notifications, and profile (login required).
- Admin Panel: Dashboard, notifications, profile, and sections to manage events, media, users, and payment records (login required).

4. Proposed solution

- Student Panel: Dashboard, notifications, and profile view.
- Admin Panel: Manage events, media, users, and payments.
- Booking System: Students can view event details and book tickets.
- Media Gallery: Displays photos and videos from past events.
- Responsive UI: Optimized for various screen sizes.
- Interactive Design: Includes transitions, icons, and videos for better UX.

5. Resource requirements

- Hardware Requirements: Computer or laptop with internet access.
- Software Requirements: Visual Studio Code (IDE), Web browser, HTML, CSS, JavaScript (for frontend).

6. Project planning

Description	Weeks														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
1) Requirement gathering, planning, and interface design ideas															
2) Designing homepage, event page, and gallery page															
3) Implementing student panel (dashboard, profile, notifications)															
4) Implementing admin panel (event/media management, payment records etc..)															
5) Report writing, compiling screenshots, formatting, and final review
